

Weather Classification with MONAI (Deep Learning)

SUMMER ZHANG & TINA LIU

Project Goal

Initiative: Many industries need to identify current and past weather conditions to help them plan, organize and optimize their operations.

Goal: Accurately categorize input (weather images) into 11 categories.

Further applications

- Our model is applicable in many fields:
 - Farming
 - Self-driving cars
 - Smart transportation systems
 - Outdoor vision systems

How we achieved our goal?

- MONAI (open-source AI framework)
 - PyTorch-based framework for deep learning
- Steps:
 - Create a MONAI Dataset for training and testing
 - Use MONAI to transform pre-process data (pipeline)
 - Use the DenseNet from MONAI for the classification task
 - Train & Evaluate the model

What went well? V.s. What not went well?

- Expensive to train locally – switch to Kaggle/colab instead
- Metric Score is not as high as expected
- Detailed tutorial of MONAI online – easy to follow
- MONAI has its own pipeline to pre-process the data

Performance Metric

precision	recall	f1-score
0.6529	0.6410	0.6436

Thank you
